27 June 2022

Unplugged Security Review Summary

- PwC was asked to perform a security review of Unplugged's mobile app and website.
- The testing method that was chosen for the review is "Gray Box" testing (an attacker with an access to the system, in this case a user).
- The testing methodology is based on OWASP TOP 10 vulnerabilities.
- Based on the assessment to the mobile app, it was evident that the attack surface was reduced to a bare minimum, access controls were put in place, and inputs are well-validated before being presented, which indicates a highly secure environment.
- The test was conducted on 9 June 2022, software version VO.5.41, no security risks were identified.
- Based on the aforementioned, we estimate the tested system risk score as **Low**.
